#### Abstract

A very close link of G-S, the Gibbard-Satterthwaite theorem to Arrow's "impossibility" theorem is shown. G-S is derived as a corollary: from a strategy-proof singleseat election method F is constructed an election method G that contradicts Arrow's theorem.

Assumptions F is a preferential election method for v voters and n candidates, $\mathrm{n}>2: \mathrm{R}=\mathrm{F}(\Omega)$ where $R$ is the social preference relation determined by the profile $\ell=\left(R_{1}, \ldots, R_{v}\right)$ and $R_{i}$ is the ballot preference relation of voter $i$. Let $P$ and $P_{i}, I$ and $I_{i}$ be the relations of strict preference and indifference associated with R and $\mathrm{R}_{\mathrm{i}}$. Assume that
(i) each $R_{i}$ is freely chosen as one of the $n$ ! linear orderings of the candidates;
(ii) there are two I-classes, a singleton class with the unique F -winner $\mathrm{W}_{\mathfrak{q}}$ and the rest;
(iii) for every candidate X there are profiles $\mathbb{Q}$ so that $\mathrm{X}=\mathrm{W}_{\mathbb{R}}$;
(iv) $F$ is nondictatorial in the sense that no fixed $d$ has $W_{\mathbb{R}}$ top-ranked in $R_{d}$ for all $\Omega$. Theorem (Gibbard 1973, Satterthwaite 1975) F is not strategy-proof.

This means that i and $\mathbb{a}=\left(R_{1}, \ldots, R_{i}, \ldots, R_{v}\right)$ exist so that $i$ 's preference as expressed by $R_{i}$ is better served by another relation $\mathrm{R}_{\mathrm{i}}$ and profile $\mathbb{R}^{\prime}=\left(\mathrm{R}_{1}, \ldots, \mathrm{R}_{\mathrm{i}}, \ldots, \mathrm{R}_{\mathrm{v}}\right)$, thus $\mathrm{W}_{\mathbb{R}}, \mathrm{P}_{\mathrm{i}} \mathrm{W}_{\mathfrak{R}}$. The switch from $R_{i}$ to $\mathrm{R}_{\mathrm{i}}$ is a strategic vote for i . The following proof by contradiction constructs another voting method $G$ so that $Q=G(\Omega)$ would be linear with the same winner as $R=F(R)^{1}$. Proof: Assume F is strategy-proof. Choose by (iii) profiles $\&$ and $g$ so that $\mathrm{W}_{\&} \neq \mathrm{W}_{g}$. Change the profile stepwise from $s$ to $\mathscr{I}$, one voter switching at a time, and pick a step from $\cup$ to $\vartheta$ ' where voter i by switching from $\mathrm{R}_{\mathrm{i}}$ to $\mathrm{R}_{\mathrm{i}}$ causes a change: $\mathrm{W}_{\mathscr{U}} \neq \mathrm{W}_{\chi}$. Consider 3 possibilities:

[^0](a) $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}} \mathrm{W}_{U}$ and $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}}{ }^{\prime} \mathrm{W}_{U}$; (b) $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}} \mathrm{W}_{\mathscr{U}}$ and $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}}{ }^{\prime} \mathrm{W}_{\mathscr{U}}$; (c) $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}} \mathrm{W}_{U}$ and $\mathrm{W}_{थ} \mathrm{P}_{\mathrm{i}}{ }^{\prime} \mathrm{W}_{\mathcal{U}^{\prime}}$.

The switch from (a) $R_{i}$ to $R_{i}^{\prime}$; (b) $R_{i}^{\prime}$ back to $R_{i}$; (c) $R_{i}$ to $R_{i}$ is a strategic vote for $i$. Hence $\mathrm{W}_{\mathscr{U}} \mathrm{P}_{\mathrm{i}} \mathrm{W}_{\mathscr{U}}$ and $\mathrm{W}_{\mathscr{U}} \mathrm{P}_{\mathrm{i}}{ }^{\prime} \mathrm{W}_{U}$. Thus, to get rid of the F-winner $\mathrm{W}_{U}$,
$\left(^{*}\right)$ at least one i must switch from $\mathrm{W}_{\chi} \mathrm{P}_{\mathrm{i}} \mathrm{X}$ to $\mathrm{XP}{ }_{\mathrm{i}} \mathrm{W}_{\chi}$ for some X , i.e. let X overtake $\mathrm{W}_{U}$. For given $\mathbb{a}$ and any candidate pair $\{\mathrm{A}, \mathrm{B}\}$, raise A and B to the top two places in each ballot so that none of them passes the other. If A becomes F-winner, write AQB. Define YQY for all Y and set $\mathrm{G}(\Omega)=\mathrm{Q}^{1}$. To complete the proof, observe the consequences C1-C8 [reason in brackets].

C1: If $A$ is on top of every ballot of $\mathbb{Q}$, then $A$ is the $F$-winner $W_{Q}$.
[By (iii), choose \& so that $\mathrm{A}=\mathrm{W}_{s}$, raise A to the top of every ballot and rearrange the other candidates to obtain $\mathfrak{a}$. Nobody overtakes A in any ballot. By (*) A remains F-winner.]

C2: If all top $r$ ballot places are occupied by $\mathrm{A}_{1}, \ldots, \mathrm{~A}_{\mathrm{r}}$, one of them is the F-winner.
[If $\mathrm{X} \notin\left\{\mathrm{A}_{1}, \ldots, \mathrm{~A}_{\mathrm{r}}\right\}$ is F-winner, raise $\mathrm{A}_{1}$ to the top in all ballots. By C1, $\mathrm{A}_{1}$ becomes F -winner, but X is not overtaken in any ballot and $\left(^{*}\right)$ is contradicted.]

C3: If A is the F -winner, then A is also G -winner: AQX for every other candidate X .
[Raise A and any X to the top two places in every ballot so that none of the two passes the other.
Nobody overtakes A in any ballot, thus A remains F-winner and AQX.]
C4: Q is linear, i.e. reflexive, complete and antisymmetric.
[Apply the definition of Q and C 2 with $\mathrm{r}=2$.]
C5: G is IIA, "independent of irrelevant alternatives" (Arrow 1963).
[Apply the definition of Q and C 2 with $\mathrm{r}=2$. Rearranging ballot positions $3, \ldots, \mathrm{n}$ will not change the F-winner. The partition $\left\{\mathrm{i}: \mathrm{AP}_{\mathrm{i}} \mathrm{B}\right\} \cup\left\{\mathrm{i}: \mathrm{BP}_{\mathrm{i}} \mathrm{A}\right\}$ of the voter set determines if AQB or BQA .]

C6: $\mathrm{Q}=\mathrm{G}(\mathbb{Q})$ is transitive.

[^1][If $G(R)$ has a cycle $X_{1} Q X_{2} \mathrm{QX}_{3} Q X_{1}$, raise $X_{1}, X_{2}, X_{3}$ to the top 3 places in each ballot, so that no $\mathrm{X}_{\mathrm{i}}$ overtakes an $\mathrm{X}_{\mathrm{j}}$. By C5, the cycle persists, which contradicts C 2 and C 3 .]

C7: G satisfies the Pareto condition.
[If $\mathrm{AP}_{\mathrm{i}} \mathrm{X}$ for all i , then AQX by the definition of Q and C 1 .]
C8: G is nondictatorial.
[A dictator $d$ in $G$ is by (iv) not dictator in $F$. If $d$ prefers $Y \neq A=W_{a}$, C3 contradicts the dictatorship of din G.]

Thus the assumption of a strategy-proof F implies the existence of G with properties ( $\mathrm{C} 4, \mathrm{C} 5$, C6, C7, C8) which are mutually incompatible by Arrow's impossibility result.
